

Team 67 Definition of Done

Document Type	Team Standard	Version	1.0
Owner	Scrum Team	Review Cycle	Each Sprint / As Needed

1. Purpose

This Definition of Done (DoD) establishes the minimum quality standard that every Product Backlog Item must satisfy before the Scrum Team considers the work complete. It promotes consistent quality, transparency, and a shared understanding of what “Done” means for the web application.

2. Scope

This standard applies to user stories, defects, technical tasks, and other Product Backlog Items that result in changes to the web application. Criteria that are not applicable to a specific item may be marked as not applicable only when the Scrum Team agrees that the criterion does not affect the quality or usability of the Increment.

3. Definition of Done Criteria

A Product Backlog Item is considered Done only when all applicable criteria below have been satisfied:

#	Criterion	Completion Standard
1	Requirements and Acceptance	All acceptance criteria for the Product Backlog Item have been met, and the implemented behavior matches the agreed user story or requirement.
2	Functional Completion	The feature is fully implemented and operates as intended without unfinished placeholders, disabled core functionality, or known critical defects.
3	Code Quality	Code follows the team’s coding standards, naming conventions, architecture guidelines, and established project structure.
4	Peer Review	The completed code has been reviewed by at least one other team member, and required review comments have been resolved.
5	Testing	Relevant unit, integration, and/or functional tests have been completed and passed. Manual testing has also been performed where appropriate.
6	Regression Protection	Existing application functionality has been checked to ensure the change does not introduce unacceptable regressions.
7	Browser and Responsive Behavior	The feature functions correctly in the browsers and screen sizes supported by the project, including responsive layouts where applicable.
8	Security	Applicable security requirements have been addressed, including input validation, authentication, authorization, secure data handling, and protection against common web vulnerabilities.
9	Merge and Integration	The completed work has been merged into the team’s designated integration or main development branch with no unresolved merge conflicts.
10	Documentation	Required technical documentation, user-facing documentation, API documentation, comments, or configuration notes have been updated.
11	Deployment	The feature has been successfully deployed to the team’s testing or staging environment and is available for verification.
12	Product Review	The Product Owner or designated reviewer has confirmed that the completed work satisfies the agreed acceptance criteria and provides the intended value.

4. Use of the Definition of Done

- The Scrum Team should evaluate each Product Backlog Item against this Definition of Done before marking the item complete.
- Work that does not satisfy the applicable criteria remains incomplete and should not be represented as part of a completed Increment.
- The team may strengthen this Definition of Done over time as its development practices, automation, and quality standards mature.
- Any changes to this document should be discussed and agreed upon by the Scrum Team so that the meaning of Done remains transparent to everyone.
