

BucHunt Development Team 67

Definition of Ready

Document Version: 1.0

Project: ScavengeRUS / BucHunt

Purpose: Establish the minimum conditions a Product Backlog Item (PBI) must meet before it can be selected for a Sprint.

Definition

A Product Backlog Item is considered **Ready** when the development team has enough information to understand, estimate, and begin the work with no major unresolved issues.

A PBI should not be brought into a Sprint until the following conditions have been reviewed by the development team.

Definition of Ready Checklist

1. Clear and Understandable

The PBI is clearly written and understandable by the development team. The team understands what needs to be accomplished and why the work is needed.

2. SMART / INVEST

The PBI follows **SMART and/or INVEST principles where applicable**. It should be specific enough to understand, valuable to the project, and possible to complete and verify.

3. Clear Acceptance Criteria

The PBI has clear and testable acceptance criteria. The development team understands what conditions must be satisfied for the PBI to be successfully completed.

4. Supports the Sprint Goal

The PBI contributes to the goal of the upcoming Sprint and provides value toward the current development objectives.

5. Dependencies Identified

Dependencies on other PBIs, systems, services, data, or team members have been identified. Major blockers should be resolved or have a clear solution before work begins.

6. Groomed and Sprintable

The PBI has been reviewed during backlog grooming/refinement and is small enough to reasonably complete within one Sprint. A PBI that is too large should be broken into smaller PBIs.

7. Estimated

The development team has estimated the PBI using the team's agreed estimation technique, such as **Planning Poker and story points**.

8. Team Agreement

The development team agrees that the PBI is sufficiently understood and prepared to enter the Sprint.
